

1. What is a Smart Resume Parser?

A system that extracts useful information from resumes.
It converts unstructured data into structured format.

2. What is the main objective of your project?

To extract skills, education, and experience from resumes.
And convert them into structured data.

3. Why did you choose this project?

It solves a real-world recruitment problem.
It also helps me learn NLP concepts.

4. What problem does your project solve?

It converts messy resume text into organized data.
This saves time and effort.

5. How is your project useful for recruiters?

It automates resume screening.
Helps recruiters quickly find suitable candidates.

6. What are the key features of your system?

Text extraction, cleaning, and skill detection.
Structured output and simple UI.

7. What technologies are used in your project?

Python, spaCy, PyMuPDF, docx, Streamlit.
Used for processing and UI.

8. Why did you choose Python for this project?

Python is simple and powerful.
It has many useful libraries.

9. What is Natural Language Processing (NLP)?

It is a technique to process human language.
Helps machines understand text.

10. How is NLP used in your project?

It analyzes resume text.
Extracts useful information like skills and names.

11. How do you extract text from PDF files?

Using PyMuPDF library.
It reads and extracts text from PDFs.

12. How do you extract text from DOCX files?

Using python-docx library.
It reads Word document content.

13. What is PyMuPDF and why is it used?

It is a library for handling PDFs.

Used for fast text extraction.

14. What is the role of the docx library?

It processes Word files.
Extracts text from DOCX resumes.

15. What challenges did you face while extracting text?

Different resume formats.
Sometimes text is not properly aligned.

16. How do you handle different resume formats?

Using flexible parsing logic.
Apply rules for different layouts.

17. How do you deal with encoding issues?

Using UTF-8 encoding.
Ensures correct text reading.

18. What happens if the PDF is scanned (image-based)?

Text cannot be extracted directly.
OCR is required to read images.

19. How do you ensure accurate text extraction?

By using reliable libraries.
And testing with multiple resumes.

20. What preprocessing steps do you apply to extracted text?

Cleaning and removing special characters.
Converting text into proper format.

21. What is tokenization?

Breaking text into words.
First step in NLP.

22. What is lemmatization?

Converting words to base form.
Example: running → run.

23. Difference between stemming and lemmatization?

Stemming cuts words roughly.
Lemmatization gives meaningful base words.

24. What is Named Entity Recognition (NER)?

Identifies important entities in text.
Example: names, locations.

25. How does spaCy help in your project?

It processes and analyzes text.
Helps in entity extraction.

26. What entities do you extract using spaCy?

Names, organizations, and locations.
Useful for resume parsing.

27. How do you identify sections like skills and education?

Using keywords like Skills or Education.
Helps locate sections.

28. What are stop words and why are they removed?

Common words like the, is.
Removed to improve accuracy.

29. What is POS tagging?

Identifies parts of speech.
Example: noun, verb.

30. How do you clean noisy text?

Remove special characters and spaces.
Normalize the text.

31. What is regex and how is it used?

A pattern matching technique.
Used to find emails and phone numbers.

32. How do you extract emails and phone numbers?

Using regex patterns.
Matches standard formats.

33. How do you identify skills in a resume?

By matching keywords.
Compare with skill list.

34. How do you detect work experience?

By finding roles and dates.
Analyze job history.

35. How do you extract education details?

Search for degrees and colleges.
Use keywords and patterns.

36. How do you handle missing or incomplete data?

Skip or assign default values.
Ensure smooth processing.

37. How do you deal with duplicate information?

Remove repeated entries.
Keep unique data.

38. How do you structure extracted data?

Organize into key-value format.
Example: JSON.

39. What format is used for output?

JSON or CSV.
Easy to store and use.

40. Why did you choose JSON/CSV formats?

They are simple and portable.
Widely supported formats.

41. What is the workflow of your project?

Upload → Extract → Clean → Analyze → Output.
Complete process flow.

42. How does the system process a resume step-by-step?

Reads file, extracts text, cleans it.
Then analyzes and gives output.

43. How do you design the architecture of your project?

Divide into modules like extraction and processing.
Each module handles a task.

44. How do you ensure scalability of your system?

Use cloud services.
Optimize processing.

45. How can your project be improved?

Add better ML models.
Improve accuracy and speed.

46. Why did you use Streamlit?

It is easy to build web apps.
Requires less coding.

47. How does the user interface work?

User uploads resume.
System shows extracted data.

48. How can users upload resumes in your system?

Using file upload option.
Supports PDF and DOCX.

49. How are results displayed to the user?

As tables or JSON format.
Easy to understand.

50. How did you deploy your project?

Using Streamlit Cloud.
Accessible online.
